

Cold aisle high density 2025 model

Overview

High-density modular data center with 2.0mm cold rolled steel, 1100kg static payload, and hot air containment for efficient cooling. But in 2025, that model is under pressure. The rise of AI workloads, GPU clusters, and high-density racks is straining the limits of air cooling. Enter immersion cooling, once a niche. The module adopts advanced high-frequency switching technology, fully digital DSP control technology and the world's leading active PFC and LLC topologies to achieve high input power factor, accurate output current sharing performance, and reliable monitoring and management system. Standardized liquid cooling. The average AI rack will cost \$3. Part of this shift is a data center deploying a coolant distribution unit data center setup.
