

Core switch network instability

Overview

Tracking down STP topology changes involves a series of steps, moving from core switches through to edge devices. This practice enables network administrators to identify the port or device causing network instability, thus enabling timely intervention. Spanning Tree Protocol (STP) is crucial in preventing network loops, which can cause widespread disruptions in Ethernet networks. We have a pair of Dell N3224P-ON switches and today's morning my colleague gave me a task and instructions to remove some unused VLANs. I'm sure I removed the correct VLANs. When I saved the configuration, everything stopped working and now we don't know what to do. But for some reason, a lot of switch vendors disable it by default. What method is there?

Not Configuring Spanning Tree at All Letting The Network Pick Your Root Bridge Using Legacy 802.1D Mixing Spanning Tree Types Using MST with Pruned Trunks Conflicting Root Bridge and HSRP/VRRP Another common topological problem with spanning tree networks involves the way that Layer 2 and 3 redundancy mechanisms sometimes interact. Suppose I have a network core consisting of two Layer 3 switches. On each segment I want these core switches to act as redundant default gateways. And I want to connect all of the downstream switches redundant... See more on [auvik Reviews: 23](#) Published: Oct 24, 2024 Kerry Cordero
