

Function of Low-voltage busbar clamps

Overview

Low voltage busbars are used in systems where the voltage level is below 1000 volts. These busbars serve as a centralized hub for electrical power distribution, efficiently transmitting electricity from a power source to various devices within an electrical network. Busbar supports, also known as busbar clamps or busbar braces, are electrically insulating supports designed to hold live electrical conductors known as busbars. Behind every reliable low voltage switchgear lineup is a design balance that is harder than it first appears: current must flow safely, heat must be controlled, internal space. With SIRIUS, SENTRON, SIVACON and ALPHA, we offer an innovative portfolio for standard-compliant and demand-oriented applications. Efficient engineering tools and innovative cloud-based solutions can be flexibly tailored to individual requirements.
