Fiber optic cable splicing is the process of joining two fibers end-to-end to create a continuous optical path., FTTH, FTTP, FTTM), splicing is essential for extending cables, repairing breaks, or connecting backbone and distribution lines. To protect these vulnerable. Fiber optic cables are the invisible highways of our digital world, carrying massive amounts of data at the speed of light. Either joining method must have three primary characteristics. In this guide, we cover the basics of fiber optic splicing, how to perform splicing using two different methods, and finally some best practices to perform good fiber splicing: What is Fiber Optic Splicing and Why is it Needed?
