

Polarization-maintaining FC interface angle accuracy

Overview

The tolerances between the key and keyway on standard FC connectors are too loose to accurately maintain angular alignment, so manufacturers have tightened the key dimension tolerances on PM connectors, based on FC angle-polished connector (APC) standards. Polarization-maintaining connectors feature a positioning key aligned to the slow axis of the fiber. The key permits the connector to be mated only with another connector or component at a single angular orientation. The FC/PC single mode connectors on this page feature a pre-radiused (20 mm). The defined interface between a laser source and the more sensitive environment of the measurement setup provides the physical separation that enables a mechanical and thermal decoupling, suppressing mutually negative effects. Our exclusive Space Extranet is a dedicated hub for professionals and partners.

Polarization-maintaining FC interface angle accuracy

In several iterations, the optimal rotation angle was determined and, for standard fibers, the optical polarization optimized by a polarization controller. With the optimum angle, a transmission spectrum ...

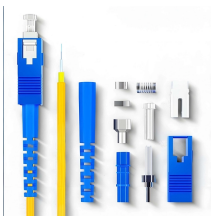

Hybrid terminated connectors enable users to adapt FC/PC or FC/APC patchcords for compatibility with existing fiber assemblies. Typical extinction ratios between 18 - 25dB maintain input polarization ...

For making alignment technology of PANDA polarization maintaining fiber (PMF) more efficient, we propose a method based on Polarization Observation by the Lens-effect Tracing (POL) ...

For use with Polarization-Maintaining Fiber, we offer the 30125D2 FC/PC style connector. This connector's key is continuously adjustable, allowing precise alignment with the axis of the PM fiber.

The FC/APC (angle polished) connector can not be mated to a standard polished connector (FC/PC, Super or Ultra). The fibers will not contact and light will not be transmitted.

Highly accurate polarization alignment of the fibers' optical axes for consistent and reliable signal transmission. Guarantees precise fiber and polarization alignment to preserve the highest possible ...

There are a few important issues when dealing with the delivery of polarization information over PM fibers, the key ones being how to preserve such information over longer distances and how to ...

For standard single-mode fibers the light is guided in two principle states of polarization. Imperfections in the fiber do lead, however, to random power transfer between the two principle states of polarization ...

Polarization-maintaining connectors feature a positioning key aligned to the slow axis of the fiber. The key permits the connector to be mated only with another connector or component at a single angular ...

When using a focal length too small, the convergence angle of the focused laser spot is larger than the maximally acceptable divergence angle of the fiber - the coupling efficiency is diminished.
