

Tensile Test Method for Optical Cable Joint Boxes

Overview

The tensile test is conducted as per the IEC test procedure and measurements are made in order to analyze the fiber attenuation as a function of the load on the cable during installation. The Tensile strength test is performed according to IEC 60794-1-2 Method E1. You rely on this property to ensure the reliability of your cable during installation and operation. Proper tensile strength testing helps you prevent cable damage and maintain network. Standard / Testing Method: IEC 60794-1-21 E1, EN 187000 Method 501, EIA/TIA-455-33, FOTP-33, IEEE 1222 Objective This test method applies to optical fiber cables that are subjected to a specified tensile load to evaluate the relationship between optical attenuation and fiber elongation strain under. Optical fibre cables - Part 1-311: Generic specification - Basic optical cable test procedures - Cable element test methods - Tensile strength and elongation test for cable elements, Method G11A IEC 60794-1-311:2024 describes test procedures to be used in establishing uniform requirements of. The tensile test, which is conducted on optical fiber cable is one of the major tests and all customers prefer to conduct this test either as a witness test or as a type test and in some cases as both. The rigid load frame offers high axial and.
