

The baffle in the distribution box is called

Overview

This is essentially a septic tank baffle. The septic tank baffle is used to skim out the solid and floating waste from the majority of the wastewater. The distribution box, often called a D-box, serves as the traffic controller for your septic system. A network of perforated pipes laid in gravel-filled trenches. The baffle sits inside the top of the tank and acts as a sieve, allowing only water to escape into the soakaway system while keeping solids and fats in the tank. Seven plastic pipe seals that fit 4 in. Product availability varies by location.

The Outlet Baffle: Your System's Silent Guardian
Of all septic system components, the outlet baffle is the most important part of the septic tank. This crucial component acts as a barrier that prevents the ...

But here's the problem: If the outlet baffle inside your septic tank fails, solids can make their way into the outlet pipe — and eventually clog the distribution box.

In a septic tank, the baffle serves as a barrier that directs the flow of wastewater, allowing solids to settle at the bottom while the liquid effluent rises to the top.

Precast distribution boxes serve to distribute the flow of wastewater from the septic tank evenly to the absorption field, leaching field or seepage pits. It is important that the effluent is evenly distributed to ...
