

The optical transceiver contains several optical modules

Overview

At the heart of every optical transceiver lie three essential components, often called the “Three Pillars” of optical communication: Laser — generates light. Modulator — encodes data onto the light. If you're dealing with data centers, telecommunications, or AI networking, grasping the key parameters of an optical. An optical transceiver, a crucial device utilized in optical communication, is an optoelectronic element, allowing the interconversion of optical and electrical signals during the information transmission. It generally has the components for transmission, reception, laser chips, photodetector chip. Modern communication networks rely on optical transceivers to transfer data at the speed of light. The optical signals are thereafter transmitted through the fiber optic cables at a chosen.
