### Overview

An optical power meter (or laser powermeter) is an instrument for the measurement of the optical power (the delivered energy per unit time) in a light beam, for example a laser beam. Typically, it allows for power measurements only with a relatively low bandwidth, and. What is an optical power meter?

An optical power meter (OPM) measures the power levels of light signals in devices that transmit data or power using light. For light power. Source: Amazon. It is essential for various applications in photonics and laser technology. The term usually refers to a device for testing average power in fiber optic systems. In this article, we will explore the definition.
