

What to do if the fiber optic tray is not green

Overview

I start by attaching the tube to the splice tray, then flare out the fibers, making sure they are untwisted. The SFP modules (GLC-SX-MM) are seated and the cables appear connected fine, but I get no green LED lights on either switch. That cuts installation time and errors. Colour coding is more than a neat trick. Whether setting up a new fiber link or expanding an existing one, the right colour. Fiber optic color codes provide the essential identification framework that enables fiber technicians and network professionals to manage complex optical network installations efficiently. When using a commscope or coyote closure I like to keep everything outside the tray till I am done splicing.
